2 Sample Holder Supports

These are designed to support thin-walled quartz-glass tubes which will hold the samples, using a vacuum pick-and-put system. The connection between the existing brown sample tubes and the quartz-glass tubes need to be fabricated as shown: (Scale: 1" = 1")

We need to have 4 of these teflon spacers made, with the inside diameter of the hole such that the quartz-glass tubes will fit snugly inside, but not tightly. Please check with the bit of quartz tube supplied, and fit it to the black annotized aluminum rod.
